

Part 2: What You Have Been Given - Setup & Reproducibility

- **Problem:** The evaluators and regulators cannot properly diagnose the system's failures without a highly accurate, reproducible baseline of the broken architecture.
- **Solution:** We provide a docker-compose environment and initialization scripts that perfectly recreate the original failing state, including broken schemas, disabled foreign keys, and bad configurations.
- **Why Chosen:** This satisfies the strict "evidence-of-diagnosis" requirement by isolating the exact failure modes in a safe, testable sandbox before any corrective measures are applied.
